The two Sisters who dared the Impossible

In the year 1977, just a few weeks apart, there were two thundering Launches on the surface of a Blue planet.
Aboard the rockets were two brave sisters who dared to dream of the Impossible.

Their mission?
To explore the unknown far beyond what anyone had ever done before.

Fast forward 4 Years, the sisters had explored the stormy surface of Jupiter & The icy moons of Saturn, Gathering invaluable data on the moons of our largest cosmic neighbours, such as Io's volcanic eruptions and Titan's dense methane-rich atmosphere.

But as fate would have it, this is where their paths diverged.

The sisters bid Farewell to each other, knowing they would never encounter each other ever again.

The first one of them set out to explore the very Edge of our Solar System.
While the second decided to pay a visit to Uranus and Neptune.

Ten years after that Fateful day, the 1st Sister's Energy was dwindling.
Most of her Instruments had been shut down to conserve the remaining energy.
She was growing increasingly "tired" each day as her Radioisotope ThermoElectric generators slowly degraded.

In a final attempt, She turned her gaze towards the place she was born at, the place she set out to explore for....

She opened her eyes and saw a Pale-Blue dot suspended in a Scattered Sunbeam.
Her Home....

The dot appeared so small and distant that she wasn't sure if anyone was even listening to her anymore.
But regardless, She gave it her all and sent the image towards Home.
In a final command from her Creators, she closed her eyes in an effort to preserve essential energy to keep functioning in the cold vacuum of space.

She continued her journey.
Carrying a message with her on a Gold-Plated Copper Disc, that somewhere out there, on a Beautiful Blue planet orbiting a Small Yellow Star. Life dared to venture out into a frontier much bigger than itself, And chose the two Sisters for this task.

The Sisters they affectionately called the Voyager Probes.
